## Dimensions in mm [inches]

Best results can be reached by using a thermal transfer compound with a heat conductivity of at least 1 W/mK. The flatness of the cooling plate must be better than 0.05 mm overall. Surface roughness should not exceed 6.4 µm.

## How to make a request

HPP-Configuration\_Ohmic Value\_Tolerance

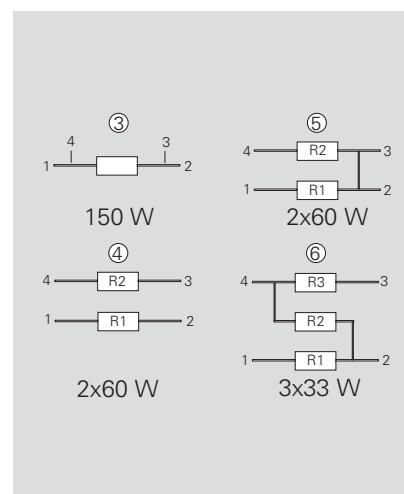

For example:

HPP-5 2x2R 10% or HPP-6 3x8K 5%

Example for higher working voltage:

HPP-4-S 2x10R 5%

## Configurations (P / package)

Version 5: ohmic value between contact 2 and 3 = 3mΩ

## Pulse Energy Curve (typical rating for HPP 150)

Note: These energy values are reference values → depending on ohmic value e.g. 1 Ω to 10 Ω and used resistive paste, a variation in max. energy load capability is possible

### Test procedure

Every test resistor was mounted with thermal compound (0.9 W/mK) on a water cooled heatsink

- Constant inlet water temperature: +50°C
- The test time of each tested resistor: 10min.
- Break time between two pulses: 1sec.
- To determine good / defect parts the ohmic value was measured before and after tests:  
a change of tolerance of more than 0.1% means defect

#### Description of Pulse Energy Curve

- Shape of pulse = e-function
- Time between two pulses = 1 second
- Pulse length = time constant of 1 tau  
(1 means ... tau = 1ms)

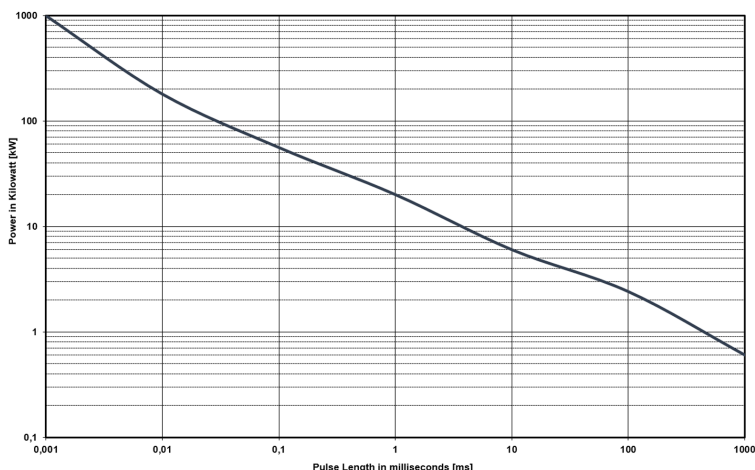

### Example

At 1 ms tau the HPP 150 with e.g. 1 Ω to 10 Ω can withstand an energy level of about 10 J, when the pulse pause time is ≥ 1s

**At a symmetrical frequency > 1 kHz at pulse length ≥ 10 μsec. the maximum applied pulse energy for HPP 150 is a result out of the nominal power 150 W divided by the operating frequency (at 85°C bottom case) ( $E = 150 \text{ W} / F$ )**

## Pulse Power Curve (typical rating for HPP 150)

The power curve shows the max. possible power which can be applied for a certain duration. Referring to the same test procedure as described above.

#### Description of Pulse Power Curve

- Shape of pulse = e-function
- Time between two pulses = 1 second
- Pulse length = time constant of 1 tau  
(1 means ... tau = 1ms)

### Example

For the time-constant of 1 ms you can apply about 20 kW max. ( $P_p = 2 \cdot E / T$ ) →, if the time between two such peaks is ≥ 1s
